Problem 1 Fulton Chapter 3 Property 6

If $F = \prod F_i^{r_i}$, and $G = \prod G_j^{s_j}$, then $I(P, F \cap G) = \sum_{i,j} r_i s_j I(P, F_i \cap G_j)$

Solution: It is enough to show that

$$I(P, F \cap GH) = I(P, F \cap G) + I(P, F \cap H)$$

if one of $I(P, F \cap G)$ or $I(P, F \cap H)$ is infinite then F has a common component with G or H . So, F has a common component with GH so, $I(P, F \cap GH) = \infty$

Assume that both of $I(P, F \cap G)$ or $I(P, F \cap H)$ is finite.

$$F, GH \in (F, G) \implies (F, GH) \subseteq (F, G) \quad O = O_P(A^2)$$

so, the natural map ϕ from $O/(F, GH)$ to $O/(F, G)$ is onto $\psi : O/(F, H) \rightarrow O/(F, GH)$ s.t. $\psi(\bar{z}) = \overline{Gz}$. So clearly ψ is a k -linear map.

Now

$$\forall \bar{z} \in O/(F, H) \phi(\psi(\bar{z})) = \phi(\overline{Gz}) = 0$$

in $O/(F, G)$ [As $Gz \in (G) \subseteq (F, G)$]. So, $\text{im}(\psi) \subseteq \ker(\phi)$

If

$$\bar{z} \in O/(F, GH) \in \ker(\phi) \implies z \in (F, G) \implies z = aF + bG$$

so, $\psi(\bar{b}) = \overline{bG} = \bar{z}$ so, $\text{im}(\psi) = \ker(\phi)$. Let $\psi(\bar{z}) = 0$. So,

$$Gz \in (F, GH) \implies Gz = a_1F + a_2GH$$

Now $\exists D \in k[x, y]$ s.t.

$$Dz = c; Da_1 = b_1; Da_2 = b_2$$

where $c, b_1, b_2 \in k[x, y]$ and $D(P) \neq 0$. So,

$$\begin{aligned} Gc = b_1F + b_2GH &\implies G(b_2H - c) = b_1F \implies F|(b_2H - c) \\ &\implies b_2H - c = Fr \quad [\text{As } F, G \text{ has no common factor}] \end{aligned}$$

So, $z = a_2H - (r/D)F$ as $D(P) \neq 0 \implies D$ is a unit in O . So, $z \in (F, H)$. So, ψ is one-one.

$$0 \longrightarrow O/(F, H) \xrightarrow{\psi} O/(F, GH) \xrightarrow{\phi} O/(F, G) \longrightarrow 0$$

this sequence is exact. So,

$$\dim_k(O/(F, GH)) = \dim_k(O/(F, G)) + \dim_k(O/(F, H))$$

So,

$$(P, F \cap GH) = I(P, F \cap G) + I(P, F \cap H)$$

□
